

Is Salary Affected by Industry, Education & Age?

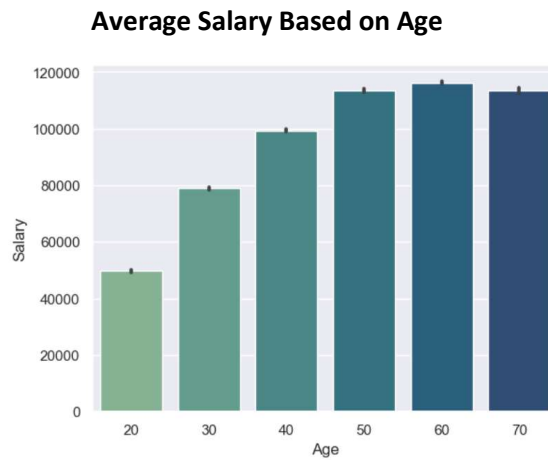

The data used provides over 25,000 results evenly distributed over 4 different industries. It ranges from 18-67 year olds and is also evenly distributed by gender.

50% of those surveyed make between \$85,000 and \$120,000 per year. Technology is the highest paying industry.

A higher education correlates with a higher potential salary.

Salary dramatically increases with age at first, but it start to plateau around age 50 until retirement.

I have found that salary is definitely affected by industry, education and age.
